
A
Belief in one's own efficacy
treatment
Free choice (compulsive)
Locked k (no diversification)
Reassurance (check AFTER acting)
Check BEFORE acting
Response prevention (k = 0 only)
Graded ERP (widening k support)
Variable-k policy
𝔼[p | D]
episode
B
Knowledge of the truth
(a proper score, not mere confidence)
treatment
log P(q*, p* | D)
episode
C
Behaviour
treatment
repetitions k
episode
D
The reassurance paradox, quantified
Graded ERP (widening k support)
Check BEFORE acting
Variable-k policy
Response prevention (k = 0 only)
Free choice (compulsive)
Reassurance (check AFTER acting)
Locked k (no diversification)
structural knowledge gained (nats)
state uncertainty removed ("am I safe now?", nats)
E
The price of finding out
Graded ERP (widening k support)
Check BEFORE acting
Variable-k policy
Response prevention (k = 0 only)
Free choice (compulsive)
Reassurance (check AFTER acting)
Locked k (no diversification)
structural knowledge gained (nats)
harm experienced during treatment
F
What is left after treatment stops
Free choice (compulsive)
Locked k (no diversification)
Reassurance (check AFTER acting)
Check BEFORE acting
Response prevention (k = 0 only)
Graded ERP (widening k support)
Variable-k policy
change in repetitions at follow-up (k_post − k_pre)
