A
locked design (deterministic)
loop area = 0.36 ± 0.23
repetitions k
objective hazard q
hazard rising
hazard falling
B
25% response-prevention quota
loop area = 0.38 ± 0.16
repetitions k
objective hazard q
hazard rising
hazard falling
C
Miscalibration while the world is getting safer
$\overline{|\mathbb{E}[q \mid D] - q|}$ (falling limb)
rising limb
locked design
25% RP quota
information seeking
pre-action probe no variation
D
Protecting against a danger that no longer exists
locked design (deterministic)
25% response-prevention quota
information-seeking
pre-action probe without action variation
repetitions k
episodes since the hazard was removed
