
A
Belief in one's own efficacy
treatment
$\mathbb{E}[p \mid D]$
episode
B
Knowledge of the truth
(a proper score, not mere confidence)
treatment
$\log P(q^*, p^* \mid D)$
episode
C
Behaviour
treatment
repetitions k
episode
Free choice (compulsive)
Locked k (no diversification)
Post-action state probe
Pre-action state probe
Response prevention ($k = 0$ only)
Graded ERP (widening k support)
Variable-k policy
D
State information is not causal information
structural knowledge gained (nats)
state uncertainty removed ("am I safe now?", nats)
E
The price of finding out
structural knowledge gained (nats)
harm experienced during treatment
F
What is left after treatment stops
Free choice (compulsive)
Locked k (no diversification)
Post-action state probe
Pre-action state probe
Response prevention ($k = 0$ only)
Graded ERP (widening k support)
Variable-k policy
change in repetitions at follow-up ($k_{post} - k_{pre}$)
