A
Four randomized schedules with $\mathbb{E}[k] = 3$
Fixed {3} (Var=0)
{2,4} (Var=1)
{1,5} (Var=4)
Uniform 0-6 (Var=4)

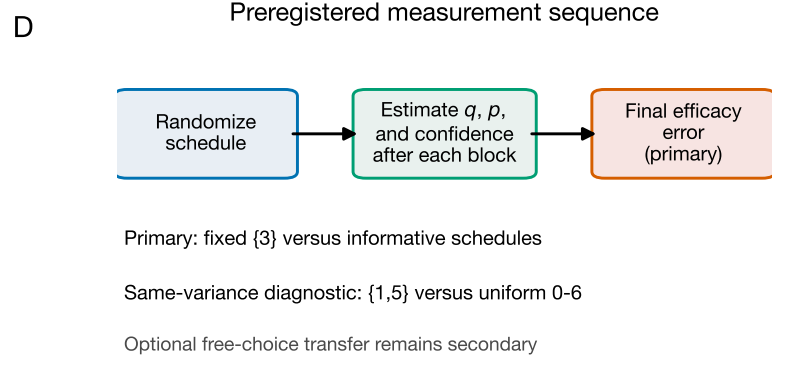
0.6
$|\mathbb{E}[p \mid D] - p^*|$



D
Preregistered measurement sequence
Randomize schedule
Estimate q, p, and confidence after each block
Final efficacy error (primary)
Primary: fixed {3} versus informative schedules
Same-variance diagnostic: {1,5} versus uniform 0-6
Optional free-choice transfer remains secondary
